Raksh Path (■■■■ ■■) — User Guide

How to Use the All-Natural-Disasters Emergency Routing Platform across India

Web Address: Open your browser (Chrome/Edge/Firefox) and visit: http://localhost:5173
Supported Disasters: Floods, Earthquakes, Cyclones, and Landslides across India.
Core Promise: Shows verified safe routes that avoid dangerous traps and confirms open hospital beds.

1. The Three Main Areas on Your Screen

When the app opens, you will see a simple, clean layout divided into three parts:

- **Top Header Bar:** Pick your disaster type, switch cities, toggle Civilian Mode, or click the red Emergency SOS 112 button.
- **Center Map:** Shows all streets color-coded (Green for safe, Amber for caution, Red for blocked). Draws the cyan safe route when you click an emergency.
- **Right Information Panel:** Shows your verified safe route card, travel time, reasons why the road is safe, and step-by-step driving guidance.

2. How to Use the App (Step-by-Step)

Step 1: Pick Your Disaster Type (Top Header)

Click on any of the 4 disaster buttons at the top of the screen to match the active emergency:

Disaster	Hazards It Evaluates	Safe Route Action
■ **Flood**	Submerged underpasses, deep river water, rising street flooding	Diverts vehicles away from deep water to elevated, dry bridge decks.
■ **Earthquake**	Structural bridge cracks, fallen building facades, road fissures	Avoids damaged overpasses; routes via modern reinforced concrete highways.
■ **Cyclone**	Gale winds (140 km/h), uprooted banyan trees, live electric wires	Avoids narrow tree-lined roads; routes via broad cleared avenues.
■■ **Landslide**	Saturated mountain slopes, rockfalls, boulders blocking valley passes	Bypasses sheer cliff roads; routes via protected valley bypasses.

Step 2: Choose Your City / Region

Click the **Region dropdown** at the top and select your city: **Delhi NCR**, **Mumbai**, **Patna**, **Guwahati**, **Kolkata**, **Chennai**, or **Prayagraj**. The map will instantly center on your chosen city and load all local hospitals and emergency calls.

Step 3: Click an Incident to View Your Safe Route

In the incident list on the right (or by clicking any pin on the map):

1. Click any emergency call (e.g. *'Daraganj Riverbank Water Rescue'* or *'Civilian Emergency'*).
2. A **solid cyan route** will appear on the map guiding the vehicle safely to the hospital.
3. Read the **Verified Safe Evacuation Path** card on the right:

- **Estimated Travel Time:** Shows transit time in minutes (e.g. *14 min*).
- **Why This Route Is Safe:** Confirms that modern bridges and high, dry highways are used.
- **Hazard Diverted:** Tells you the exact danger bypassed (e.g., *'Bypassed 45cm flooded underpass to prevent engine stalling'*).
- **Hospital Beds Ready:** Confirms the hospital has free Trauma and ICU beds ready right now.

Step 4: Step-by-Step Driving Directions

Scroll down the right panel to view the 4-step route instructions:

- **Step 1 (Depart):** Start safely from the station using dry, wide arterial roads.
- **Step 2 (Bridge Transit):** Cross elevated bridge decks safely standing above river surge crests.
- **Step 3 (Hazard Avoidance):** Detour around blocked lowlands or fallen tree hazards.
- **Step 4 (Hospital Arrival):** Arrive at the emergency bay with verified beds pre-allocated.

Step 5: How to Use the Emergency SOS 112 Button

Click the bright red **'Emergency SOS 112'** button at the top right to open the emergency modal:

- **One-Touch Emergency Calling:** Tap any phone number to dial 24x7 government crisis lines (112, 108, 1078 NDRF).
- **Report a Danger on Your Street:** Select the problem (*Flooded Road*, *Collapsed Building*, *Fallen Tree*, or *Landslide*) $\rightarrow$ type a short note $\rightarrow$ click **Submit Citizen Hazard Report**. The danger will immediately be marked on the map so ambulances steer clear of it.

Step 6: See Future Water Levels (Bottom Time Slider)

Look at the slider at the bottom of the map labeled **0h to 6h**:

- Drag the slider to the right (e.g. to 3h or 5h).
- You will see rain intensify and river water rise.
- Watch lower roads turn red, and watch the app automatically move routes onto higher bridges!

Step 7: Testing an Instant Roadblock Failover (Crew View)

To test what happens if an unexpected fallen tree blocks the road:

1. Switch to **Dispatcher Mode** using the toggle at the top.
2. Click the **'Crew'** button in the top bar.
3. Click **'REPORT ROAD BLOCKED'** on any road segment.
4. The system will immediately switch to the backup route in under 1 second with zero delay.

3. Quick Reference: Helplines & Road Color Codes

Emergency Helpline	Phone Number	Purpose / Department
National Emergency Helpline	**112**	All-India unified crisis response (Police, Fire, Ambulance, NDRF)
Ambulance Medical Transport	**108**	Emergency hospital transport & medical triage
NDRF Disaster Control	**1078**	National Disaster Response Force search & rescue
State Disaster Relief	**1070**	State Emergency Operations Centre (SEOC)

Map Color	Status	What It Means for You
■ **Green**	Safe & Open (100%)	Dry or very low water surface. Normal driving speed allowed.
■ **Amber**	Caution Needed	Minor surface water (15–25cm) or scattered debris. Drive slowly.
■ **Red**	Blocked / Dangerous	Deep water, building rubble, or fallen wires. Do NOT enter.
■ **Purple**	Reported Roadblock	Blocked by verified citizen SOS or emergency crew report.
